

Bryanston School provides Wireless Access for Students and Staff

Basingstoke, 12 April 2006: REACT Technologies Ltd has begun deploying Aruba Wireless access across the Bryanston School campus in Blandford, Dorset. Bryanston's campus covers 400 acres and includes various, boarding houses, academic and sporting centres for over 1000 fee-paying students and staff. Initial deployment of the Aruba Wireless solution is being focused on the boarding houses and is expected to culminate with the coverage of the new science block, currently under construction.

Bryanston, consistently ranked in the top 10 of English schools, is co-educational and takes students from age 13 through to 6th form.

Head of ICT, Andy Barnes said, "The students at Bryanston are increasingly computer literate and utilise many digital resources. Add this to the rise in the use of digital learning and support resources, and it has meant that our network topology and our working practice must have greater flexibility and coverage. Wireless networking addresses some of these problems and with the Aruba solution, we are able to set a very cost effective migration path of services, control and management with future-proofing scalability and hence we minimise the potential for drastic future changes to our network."

About REACT

REACT, headquartered in Basingstoke, Hants, was established in 2003 by former employees of technology giant Ericsson, to offer corporate customers – and particularly those with a large distributed workforce – the cost savings and enhanced security that wireless networking can bring.
